

Quick Guide

for Connection to DSL Access and the Internet

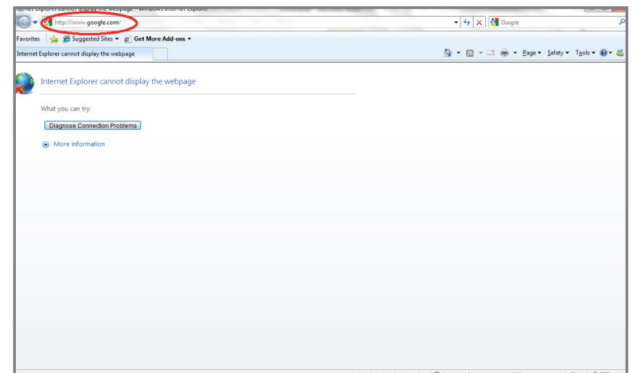

This guide will help you to reconnect to DSL Access and the Internet when your connection is interrupted. If, at some step in the guide your connection fails, you should contact the Call Centre on 132 for technical support. State the step at which you have encountered the problem in order to resolve it quickly. Keep this guide where everyone using the internet can find it easily.

1. Restart your computer.

2. Connect to DSL Access:

In the "Address" field of your browser (e.g. Internet Explorer, FireFox or other) type one of the following addresses (picture 1),

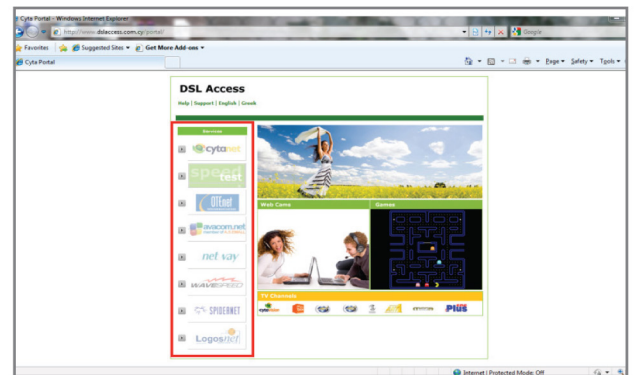

www.dslaccess.com.cy
www.i-choice.com.cy
192.168.5.2
192.168.5.2/portal

picture 1

If the DSL Access page (picture 1) does not appear proceed as below:

- Restart your ADSL modem by pressing the button on the back of the modem and wait for about one minute until the DSL or Broadband light indicator on the ADSL modem becomes stable.
- If you are using a Router between your computer and your ADSL modem, you also need to restart the Router.
- Repeat steps 1 and 2.

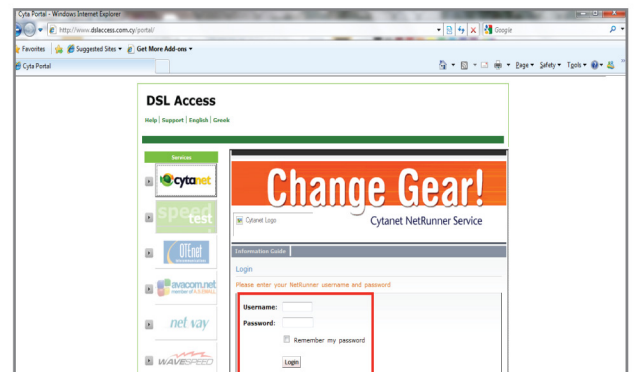

picture 2

Note: If you also have CytaVision and/or Broadband Telephony:

Restarting your ADSL modem will cause a temporary interruption to these services. They will resume once the DSL or Broadband light indicator on your ADSL modem becomes stable (you may need to change channel or restart your CytaVision set-top box to resume).

3. Connect to the Internet:

- Select the Internet Service Provider (e.g. Cytanet) with which you have an Internet account by clicking on its name or logo.
- When the login box of your Internet Service Provider appears (e.g. picture 3), enter your Username and Password (e.g. for Cytanet enter your NetRunner Username and Password as shown on the right) and click on **Login** .
